CSS Health Technologies Brings New Technology to Rural and Community Hospitals

Company will install latest web-based Financial and Patient Management software in 2012.

Nashville, TN, January 5, 2012—CSS Health Technologies introduces the first web-based [financial and patient management suite](#) exclusively designed and priced for hospitals 125 beds or less. This technology accompanies ChartSmart EMR®, introduced in 2010, to provide a total software solution for hospitals.

CSS Financial & Patient Management provides a solution for all aspects of hospital cost management including General Ledger, Budgeting, Fixed Assets, Accounts Payable, Payroll, Personnel, Time and Attendance, and Materials Management delivered in a web-based easy to use format. Patient Management facilitates Registration, Billing, Collections, Charging, Medical Records, and Claims Management.

Developers have designed a [business intelligence](#) module to provide key hospital staff with real time information needed to make better decisions to improve patient care and comply with government mandates while lowering costs. CSS Business Intelligence is fully integrated with CSS Financial and Patient Management and ChartSmart EMR®, supplying hospitals with the tools needed for clinical and financial analytics, including drill down reporting, dashboards showing key performance indicators, benchmarks, internal RAC Audits, and Meaningful Use calculations.

“The key benefit, in addition to the unbeatable customer service we provide for all of our clients, to selecting CSS Financial and Patient Management over our competitors is the business intelligence package we offer as part of our software,” said Richie Wilkes, CSS Health Technologies President and CEO. “No other company is offering this level of seamless easy-to-use analytics.”

Wilkes further added, “This is going to allow all hospitals, no matter how small, to fully realize the advantages of technology once only affordable to huge healthcare systems”

About CSS Health Technologies
